

Lesson Overview

Computers overheat easily when dust builds up inside the system unit. Regular cleaning helps maintain proper airflow, prevents lag, and extends hardware life.

TESDA NC II requires learners to **identify cleaning tools** and apply them correctly to internal components such as the CPU, fans, and vents.

Tools You Will Use

- **Blower / Compressed Air:** removes loose dust from tight spaces.
- **Anti-static Brush:** sweeps dust away safely from components.

Steps to Clean the CPU & Fan

1. **Hold the fan blades** so they don't spin too fast.
2. **Use the blower** to push out dust from vents and heat sinks.
3. **Use the brush** to clean stubborn dust on the motherboard and fan edges.
4. **Check airflow** after cleaning to ensure ventilation is clear.

Safety Notes

- Never wear a wet cloth inside the CPU.
- Keep the blower upright (avoid moisture sprays).

- Always ground yourself or use an anti-static strap.
